

INPUT Data Connector

This counter, don't need load and always is counting. So CET, CET is connected to VCC and /PE is connected to VCC too to disable load.

DIGIT Counter

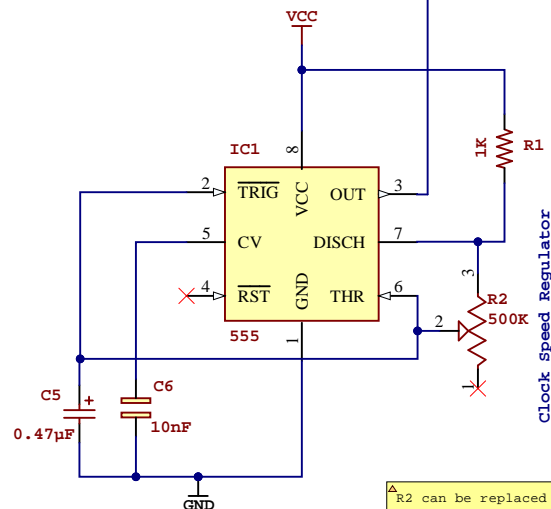

Counter control digit switch from D1 to D4. Output weight goes from QA to QD.

DIGIT Switcher

Digit selection must be synchronizing with the decoder addresses A8, A9 and the decoding code. In our case selection goes from Y3 (Dig1) to Y0 (Dig4)

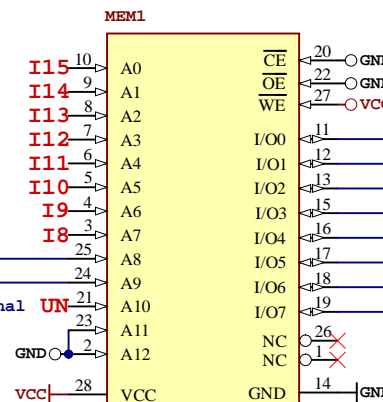

DIGIT SWITCH CLOCK

R2 can be replaced by a low value resistor between 3K-5K to set a constant speed for a digit switching at a good rate. Recommended value 4.7K
